

Pharmaceutical Intelligence Report

A Fresh Look into Drug Compatibility and Toxicity

Recommended Drugs

Drug Name: CCCCCI

Description: The drug with ID 15051, represented by the SMILES notation CCCCCI, is a chemical compound characterized by its unique molecular structure, featuring a chain of five carbon atoms bonded to an iodine atom. This distinctive arrangement of atoms confers specific chemical properties to the molecule. Its molecular characteristics suggest potential reactivity and biological activity, although its specific applications or therapeutic uses are not readily available.

Compatibility Score: 0.096, Toxicity Score: -0.087, Confidence Score: 0.091

Drug Name: O=C(O)c1cc(I)cc(I)c1O

Description: The drug with ID 3366, represented by the SMILES notation O=C(O)c1cc(I)cc(I)c1O, features a unique molecular structure with iodine substituents. This compound exhibits distinct chemical properties due to the presence of these halogen atoms, which may influence its reactivity and interactions. The specific uses and applications of this drug are not readily available, highlighting the need for further research to understand its potential therapeutic value.

Compatibility Score: 0.097, Toxicity Score: -0.084, Confidence Score: 0.090

Drug Name: Nc1ccc(I)cc1

Description: The drug with ID 4003, represented by the SMILES notation Nc1ccc(I)cc1, features a unique molecular structure with an iodine substituent on a benzene ring. This distinctive structure confers specific chemical properties to the molecule. The compound's characteristics are defined by its aromatic ring and the presence of an amino group, alongside the iodine atom, which influences its overall reactivity and potential interactions.

Compatibility Score: 0.097, Toxicity Score: -0.083, Confidence Score: 0.090

Drug Analysis Report

Drug Name: Nc1cccc(I)c1

Description: The drug with ID 4468, represented by the SMILES notation Nc1cccc(I)c1, features a unique molecular structure with an iodine substituent on a aromatic ring. This distinctive structure contributes to its chemical properties, potentially influencing its reactivity and interactions. As a specific compound, its characteristics are defined by its molecular composition, although its applications or therapeutic uses are not immediately apparent from the given information.

Compatibility Score: 0.097, Toxicity Score: -0.083, Confidence Score: 0.090

Drug Name: Oc1cccc(I)c1

Description: The drug with ID 4469, represented by the SMILES notation Oc1cccc(I)c1, features a unique molecular structure with an iodine substituent on a benzene ring. This distinct arrangement of atoms confers specific chemical properties to the molecule. The drug's molecular characteristics are notable, although its specific use case or associated diseases are not readily available.

Compatibility Score: 0.097, Toxicity Score: -0.083, Confidence Score: 0.090

Drug Analysis Report

Not Recommended Drugs

Drug Name: ClC(Cl)(Cl)C(Cl)(Cl)Cl

Description: The drug with ID 2191, represented by the SMILES notation ClC(Cl)(Cl)C(Cl)(Cl)Cl, features a highly halogenated molecular structure. This unique structure is characterized by multiple chlorine substitutions, imparting distinct chemical and physical properties. The specific applications or therapeutic uses of this compound are not readily available, but its molecular characteristics suggest potential for diverse chemical interactions.

Compatibility Score: 0.098, Toxicity Score: -0.030, Confidence Score: 0.064

Drug Name: CCI

Description: The drug with ID 2246, represented by the SMILES notation CCI, features a simple molecular structure consisting of a carbon atom bonded to a chlorine atom and an iodine atom. This unique combination of halogen atoms contributes to its distinct chemical properties. With limited information available, its specific applications or uses cannot be reliably determined.

Compatibility Score: 0.098, Toxicity Score: -0.028, Confidence Score: 0.063

Drug Name: ClC(Cl)Br

Description: The drug with ID 2259, represented by the SMILES notation ClC(Cl)Br, is a halogenated compound featuring a unique molecular structure with chlorine and bromine substituents. This molecular arrangement imparts distinct chemical properties to the compound. Further information regarding its specific uses or applications is not available.

Compatibility Score: 0.098, Toxicity Score: -0.030, Confidence Score: 0.064

Drug Name: Brc1ccsc1Br

Description: The drug with ID 5868, represented by the SMILES notation Brc1ccsc1Br, features a unique molecular structure consisting of a brominated thiophene ring. This compound exhibits distinctive chemical properties due to the presence of bromine atoms attached to the thiophene ring. Its

Drug Analysis Report

specific applications and uses are not readily available, highlighting the need for further research to understand its potential therapeutic benefits.

Compatibility Score: 0.098, Toxicity Score: -0.027, Confidence Score: 0.062

Drug Name: N#CC(Br)(Br)C(N)=O

Description: Drug 6864, represented by the SMILES notation N#CC(Br)(Br)C(N)=O, features a distinctive molecular structure with bromine substitutions and a cyano group. This unique arrangement of atoms contributes to its chemical properties. The specific applications or diseases treated by this compound are not readily available, focusing attention on its intriguing molecular characteristics.

Compatibility Score: 0.098, Toxicity Score: -0.027, Confidence Score: 0.062
